**Methodology 1** HIFI(AttributeSet:  $A$ , Dataset:  $D$ , MinSupport:  $min\_sup$ )

---

```
1: generate frequent patterns for templates on the 1st level;  
2:  $L \leftarrow 2$ ;  
3:  $Template_L \leftarrow$  pair up templates on the 1st level to generate templates on the 2nd level;  
4:  $Cand_L \leftarrow$  join patterns on the 1st level to generate candidate patterns on the 2nd level;  
5: while  $Cand_L \neq \emptyset$  do  
6:   countSupport( $D, Cand_L$ );  
7:   eliminate candidates whose support are lower than  $min\_sup$ ;  
8:    $L \leftarrow L + 1$ ;  
9:    $Template_L \leftarrow TemplateGen(Template_{L-1}, A)$ ;  
10:  CandidateGen( $Template_L$ );  
11: end while  
12: return  $\{t.patterns | t \in Template_L\}$ ;
```

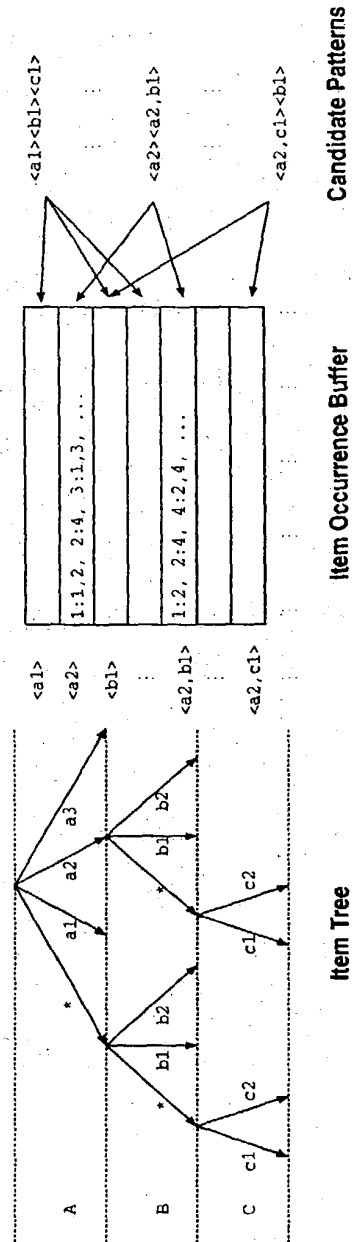

FIG. 8

---

**Methodology 2** countSupport(Dataset:  $D$ , PatternSet: *candidates*)

---

```

1: for each tuple  $t \in D$  do
2:   traverse the item tree to find all items supported by  $t$ ;
3:   for each item supported by  $t$  do
4:     record the current TID and RID in item's occurrence buffer;
5:   end for
6:   if any occurrence buffer is full then
7:     for each pattern  $p \in \text{candidates}$  do
8:       scan the occurrence buffer of each item in  $p$  (scan is synchronized by TID), and increase the count
         of  $p$  if each item of  $p$  is supported by a different record (of the same TID);
9:     end for
10:    empty all occurrence buffers;
11:  end if
12: end for

```

---

---

~~Method 3~~ TemplateGen(SetOfTemplates: *parentTemplates*)

---

```
1: Templates  $\leftarrow \emptyset$ ;  
2: for each  $p \in \text{parentTemplates}$  do  
3:   for each child template  $c$  of  $p$  do  
4:      $\text{Templates} \leftarrow \text{Templates} \cup \{c\}$  if all of  $c$ 's parent templates exist and have non-empty pattern set;  
5:   prune Templates using user preferences;  
6:   end for  
7: end for  
8: return Templates;
```

---

FIG. 10

---

**Algorithm 4** CandidateGen(SetOfTemplates: *Templates*)

---

```

1: for each  $c \in \text{Templates}$  do
2:   Let  $c_i$  and  $c_j$  be the two parents of  $c$  that have the fewest number of patterns;
3:   if joining  $c_L$  and  $c_{L-1}$  is less costly than joining  $c_i$  and  $c_j$  then
4:      $c.\text{patterns} \leftarrow \text{mergeJoin}(c_L, c_{L-1})$ ;
5:   else
6:     sort the patterns in  $c_i$  and  $c_j$  by their common attributes;
7:      $c.\text{patterns} \leftarrow \text{mergeJoin}(c_i, c_j)$ ;
8:     sort the patterns in  $c.\text{patterns}$ ;
9:   end if
10:  prune  $c.\text{patterns}$  if  $c$  has value exclusion constraints;
11:  for each parent  $c_k$  of  $c$ , and  $c_k$  does not take part in the join operation do
12:    for each pattern  $p \in c.\text{patterns}$  do
13:      remove  $p$  from  $c.\text{patterns}$  if the sub-pattern of  $p$  with regard to  $c_k$  does not exist in  $c_k.\text{patterns}$ ;
14:    end for
15:  end for
16: end for

```
